

CEJST: A Simple Map with BIG Implications

March 14, 2023

ENVIRONMENTAL POLICY
INNOVATION
CENTER

Today, we'll:

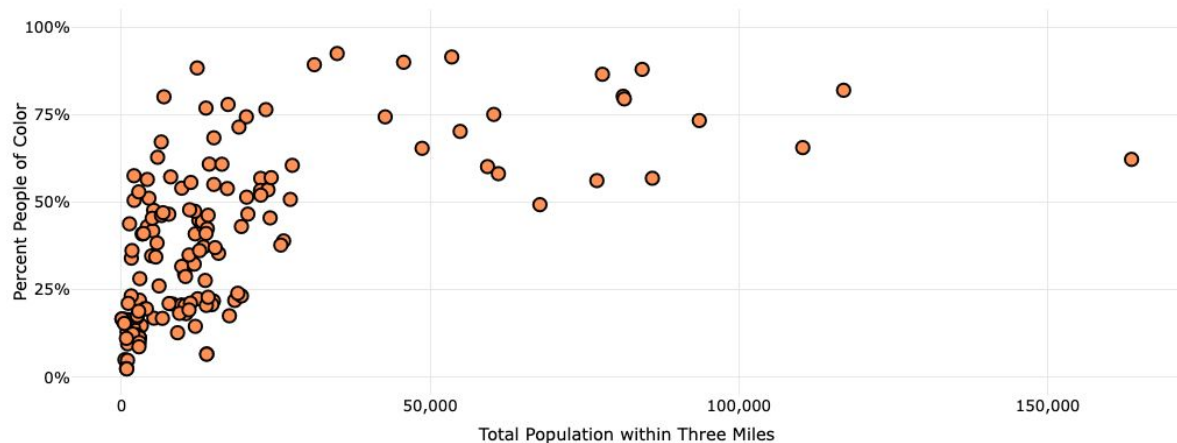

- Give a brief background on Justice40 & the Climate and Economic Justice Screening Tool
- Highlight challenges & limitations of the current version of CEJST
- Share recommendations on where adjustments to the CEJST could be helpful in advancing Justice40

Why Race?

“.....the discriminatory policies and practices that constitute environmental racism have disproportionately burdened communities of color, specifically Black Americans, American Indians/Alaska Natives (AIs/ANs), Asian Americans and Pacific Islanders, and [Latino/a] populations.”

[Confronting Environmental Racism - NIH funded research.](#)

People of Color and Proximity to New Jersey Superfund Sites

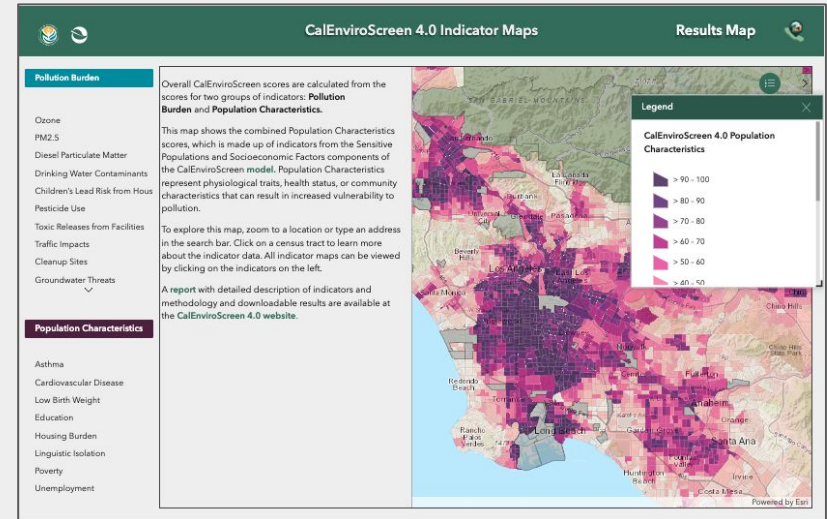

Source: The Commons, [Accessing Environmental Datasets](#)

No person in the United States shall, on the ground of race, color, or national origin, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance.
- Title VI, Civil Rights Act of 1964

Equity Tools and Policy

Tools (and their methodologies)
are written into policies.
We historically scrutinize the
policies, but not the tools!

First introduction of directing benefits to disadvantaged communities came from California's Cap & Trade Program in 2012 - yet the question still remains "how do we define disadvantaged communities?"

To help Federal agencies identify *disadvantaged communities* to prioritize funding allocations as part of the Justice40 initiative, the [Council on Environmental Quality](#) directed the [US Digital Service](#) to create the [Climate and Economic Justice Screening Tool](#).

How does CEJST work? A community is considered disadvantaged if:

Categories of Burden

There are eight “categories of burdens” and 34 datasets that quantify the burden “thresholds”

- Climate Change
- Energy
- Health
- Housing
- Legacy Pollution
- Transportation
- Water & Wastewater
- Workforce Development

&

Low Income

If a census tract is at or above the 65th percentile for low income

(as defined by household income at or below 200% of the Federal poverty level)

Also if:

- It is completely surrounded by DACs and is at or above the 50% percentile for low income
- If they are on land within the boundaries of Federally Recognized Tribes

1. Visit <https://screeningtool.geoplatform.gov/>

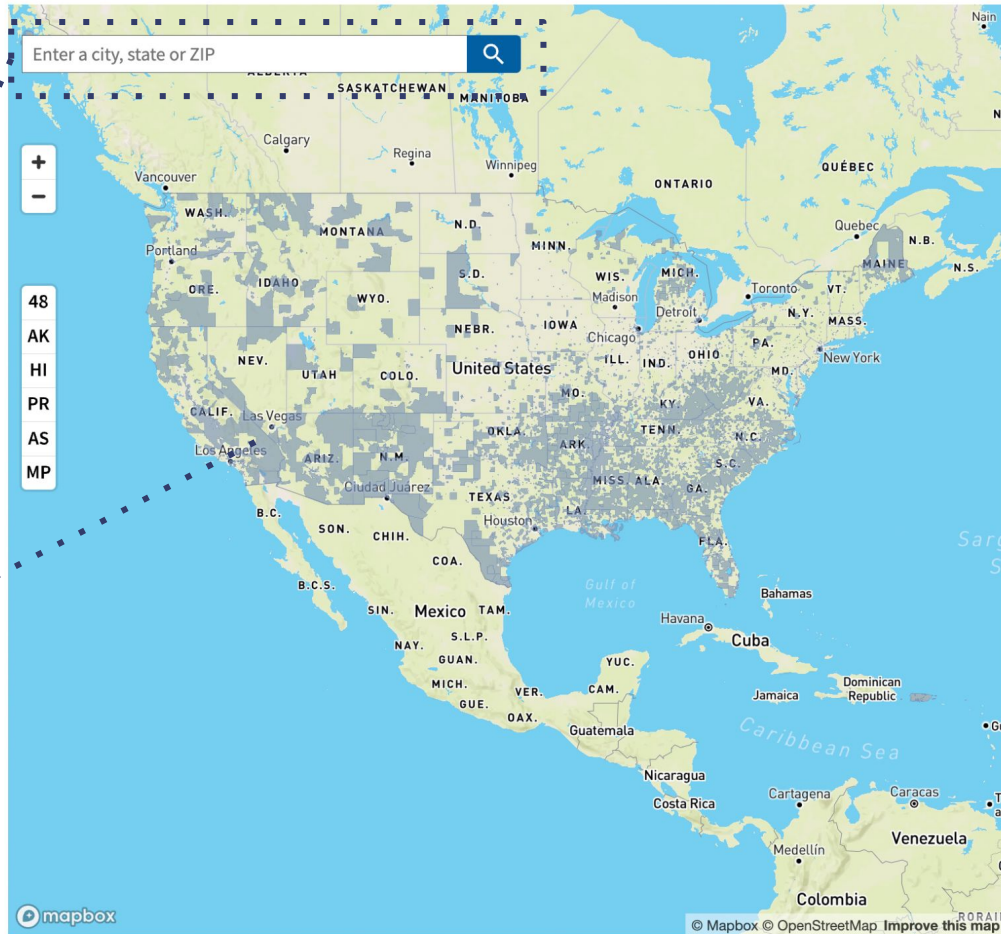

2. Go to your Area of Interest

Go to your location of interest by:

- Entering your address or ZIP

OR

- Zooming into your region

Things to know

This tool identifies communities that are marginalized, underserved, and overburdened by pollution. These communities are located in census tracts that are at or above the thresholds in one or more of eight categories of criteria.

The tool uses census tracts that represent about 4,000 people, which is the smallest unit of geography for which consistent data can be displayed on the tool.

The tool ranks each census tract using percentiles that show how much burden each tract experiences relative to all other tracts, for each criteria.

Percentages are used for

2. Evaluate census tracts and what qualifies communities as disadvantaged

The areas highlighted in “BLUE” means a census tract qualifies as “disadvantaged”

When you click on the blue census tract, you can see WHY it counts as disadvantaged & HOW MANY criteria it meets

The blue categories show which thresholds the census tract exceeds

Search for an address, city, state or ZIP

Tract information

- Number: 05141460100
- County: Van Buren County
- State: Arkansas
- Population: 3,517

Tract demographics

- Race / Ethnicity ([show](#) ▾)
- Age ([show](#) ▾)

Identified as disadvantaged?

YES

This tract is considered disadvantaged because it meets more than 1 burden threshold **AND** the associated socioeconomic threshold.

[Send feedback](#) ↗

2. Evaluate census tracts and what qualifies communities as disadvantaged

When you click on the blue census tract, you can see **WHY** it counts as disadvantaged & **HOW MANY** criteria it meets

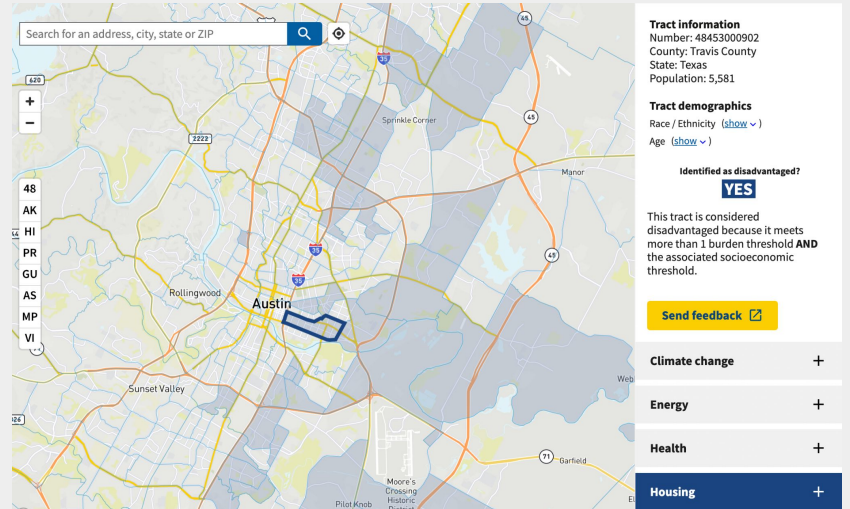

The blue categories show which thresholds the census tract exceeds

Release, Revise, Repeat

Equitable, data-driven decision making is not easy, and it'd be a miracle if we got it right the first time. Understanding where improvements can be made will get us one step closer towards realizing the vision for Justice40.

Kudos to the Council on Environmental Quality, the White House Environmental Justice Advisory Council and US. Digital Service on potentially having the fastest turnaround time on a federal tool!

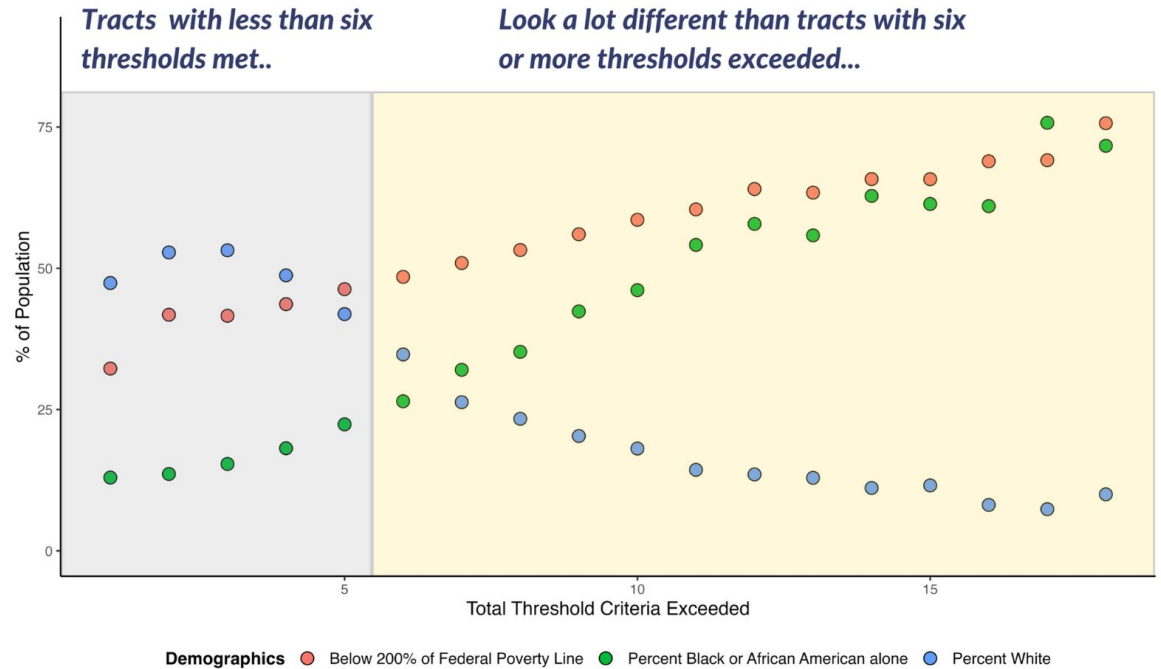

Show data cumulatively.

CEJST's binary categorization hides significant racial and income inequity. Showing data cumulatively will enable users to view and prioritize funding to those most affected by systemic environmental injustices.

Show data cumulatively.

Currently, CEJST does not adequately account for the disproportionate effects of climate and economic justice on Black and Brown communities.

Show data cumulatively.

Additions to disadvantaged areas between the Beta version and Version 1.0 are majority white.

This is largely because most tracts exceeded a small number of threshold criteria.

The qualifying areas in the Beta were majority people of color...

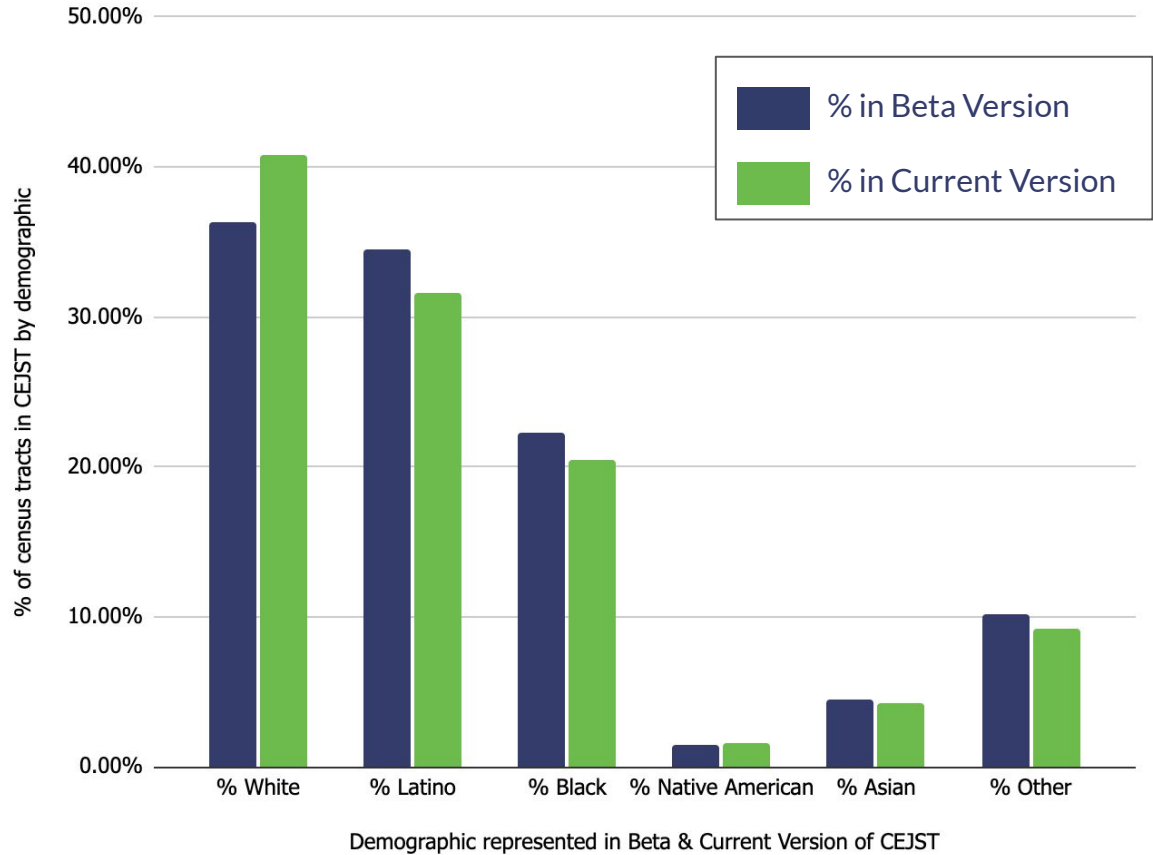

...but those added in Version 1.0 were majority white.

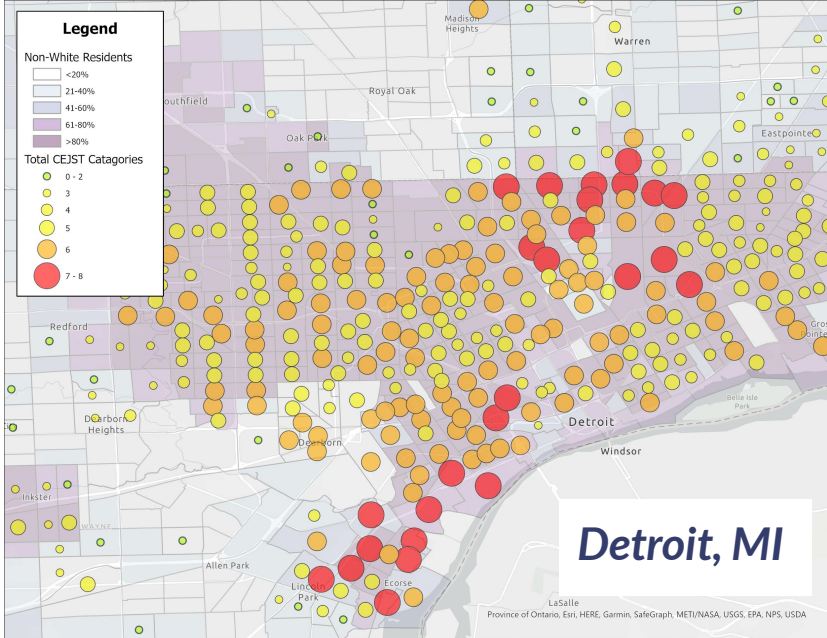

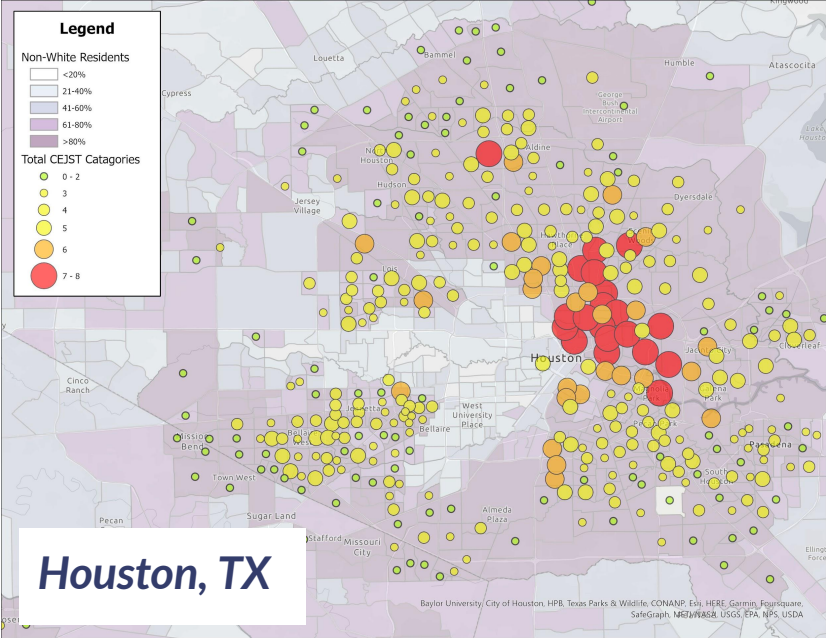

Show data cumulatively.

The communities newly added in Version 1.0 contain a population of more than 15 million people; however, the racial composition of the newly qualified additions differ significantly from the original Beta population.

This is true in several other cities as well.

Recommendation:

Restructure the tool to focus on areas exceeding multiple criteria, rather than a single threshold approach.

Revise economic screening approach.

Currently, there is too much sensitivity around one single indicator - there needs to be a less simplistic approach for income qualification.

Revise economic screening approach.

A single indicator, the 200% poverty measure, overwhelms all of the others - and is not necessarily the best way to identify low-income tracts.

Qualifies using
200% poverty,
but not 80%
AMI:
5,400 tracts

Qualifies using
both measures:
22,000 tracts

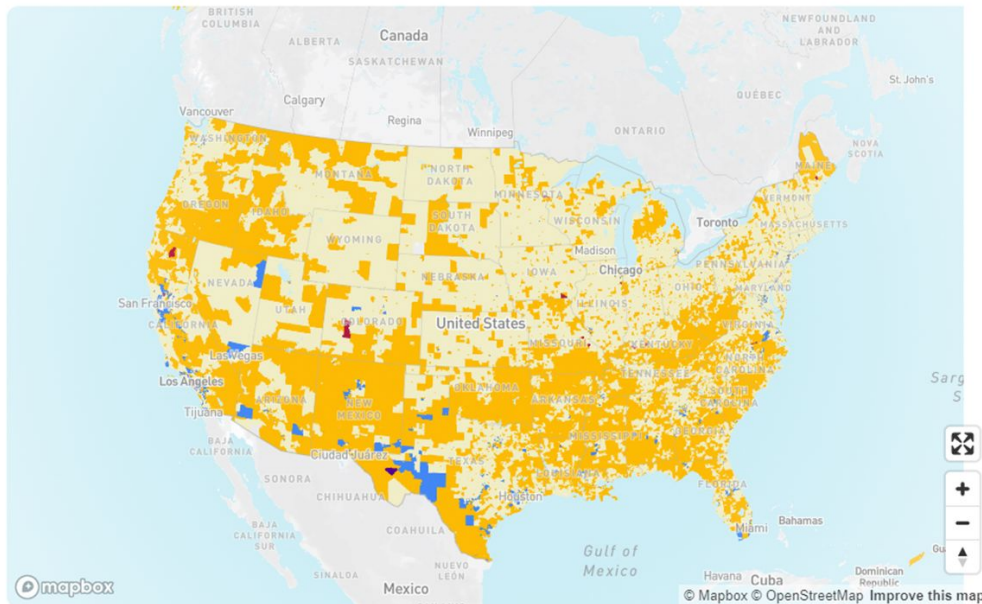

Qualifies using
80% AMI, but
not 200%
poverty:
4,600 tracts

Interactive web tool for Further CEJST Analysis

Justice40 Analysis

of CEJST Version 1 Release

Is the Justice40 Screening Tool identifying the most disadvantaged communities?

Identified as:

- Disadvantaged
- Not disadvantaged

Not identified as disadvantaged, but overburdened with:

- Cumulative environmental burdens (5 or more indicators)
- High concentration of people of color (over 50%)
- Cumulative environmental burdens and high concentration of people of color

What is the Justice40 initiative?

The Justice40 Initiative aims to deliver 40 percent of the overall benefits of federal investments in climate and clean energy, including sustainable transportation, to disadvantaged communities. But how are those communities determined, and who is left out?

This analysis looks at which communities are identified as disadvantaged in the [Justice40 screening tool](#) and which communities fall short.

To get started, explore the map or pick a census tract to see how that community scores.

[Show all filters](#)

All States All Counties

- Disadvantaged Yes No
- Overburdened Yes No
- 200% Poverty Yes No
- At or below 80% AMI Yes No

Census tract: none selected

Select a census tract by clicking a location on the map.

apps.cnt.org/justice40

Some highly impacted areas are excluded.

Identified as:

- Disadvantaged
- Not disadvantaged

Not identified as disadvantaged, but overburdened with:

- Cumulative environmental burdens (5 or more indicators)
- High concentration of people of color (over 50%)
- Cumulative environmental burdens and high concentration of people of color

Census tract: 17031590600

Not Justice40 Disadvantaged, but nearly meets its criteria

This census tract **is not** considered disadvantaged by Justice40 criteria. However, this area has both significant cumulative environmental justice burdens with thresholds in 5 of 8 categories met and 1 of 8 nearly met and has a high concentration of people of color (above the 65th percentile).

[How is Justice40 criteria defined?](#)

Justice40 Qualifications

Meets criteria (5) Nearly meets criteria (1)

1) Environmental and Climate Indicators

At least one indicator from any of environmental and climate categories below must reach the 90th percentile. Those that reach the 80th percentile are also shown to better demonstrate cumulative impacts.

What if cumulative impacts were considered?

Communities with environmental justice concerns are usually not burdened by a single environmental problem, but by many which have occurred over time and which exacerbate each other. The Justice40 screening tool does not consider this.

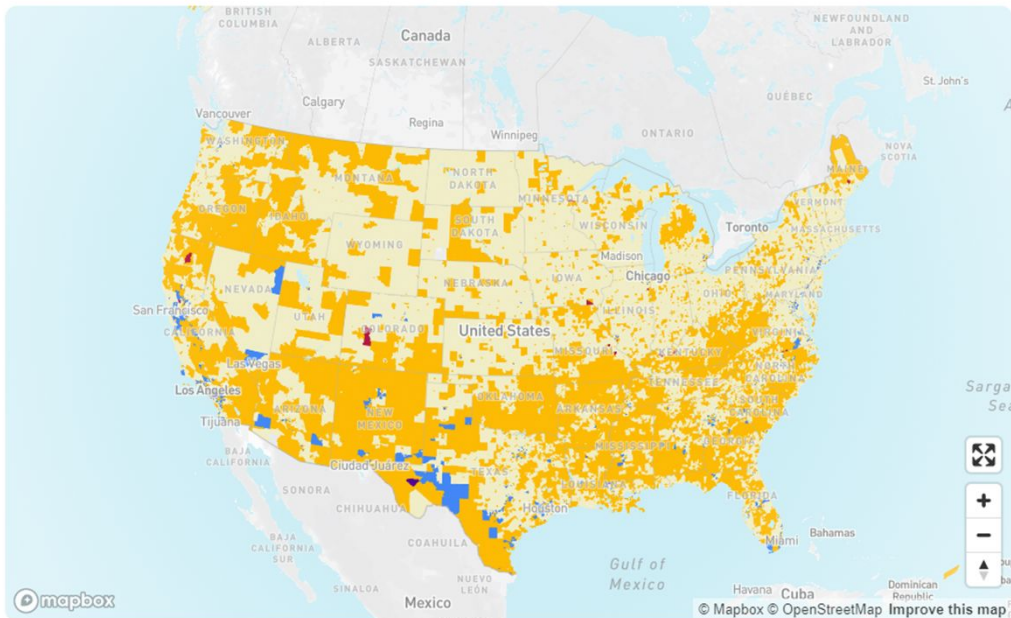

Number of categories reaching the 90th percentile: **5 of 8**

Number of categories reaching the 80th percentile: **1 of 8**

Climate change [show details](#)

[show details](#)

CNT web tool allows filtering by indicator.

Identified as:

- Disadvantaged
- Not disadvantaged

Not identified as disadvantaged, but overburdened with:

- Cumulative environmental burdens (5 or more indicators)
- High concentration of people of color (over 50%)
- Cumulative environmental burdens and high concentration of people of color

To get started, explore the map or pick a census tract to see how that community scores.

All States All Counties

Disadvantaged Yes No

Overburdened Yes No

200% Poverty Yes No

At or below 80% AMI Yes No

Qualify for Environmental Justice Indicator

Climate change

- Expected agricultural loss rate
- Expected building loss rate
- Expected population loss rate
- Share of properties at risk of flood in 30 years
- Share of properties at risk of fire in 30 years

Clean energy and energy efficiency

- Energy burden
- PM2.5 in the air

Clean transit

- Diesel particulate matter exposure

Census tract: none selected

Select a census tract by clicking a location on the map.

...if 80% AMI were added as a qualifying factor, the purple, red, and blue areas above would also be disadvantaged

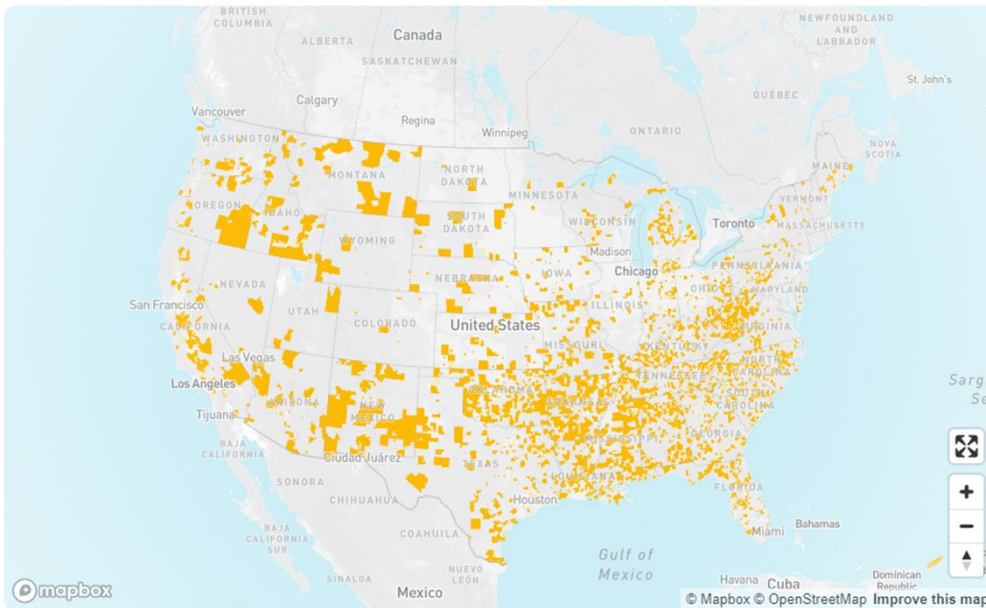

...if 80% AMI replaced 200% poverty as a qualifying factor, the orange areas above would no longer be disadvantaged

Adjusting economic indicator has a major impact.

- Overburdened Yes No
- 200% Poverty Yes No
- At or below 80% AMI Yes No

Census tract: none selected

Select a census tract by clicking a location on the map.

Recommendation:

The single economic indicator is as influential as all of the climate indicators combined, and a more complex approach is needed.

Explore how much individual indicators affect disadvantaged status:

apps.cnt.org/justice40

Include filters by category.

The CEJST interface only shows a specific community's burden categories, rather than communities by a burden category. Viewing the data through filters by category would reveal regional and state trends, and facilitate issue specific advocates to prioritize 'hotspots' for investment.

The state breakdown of most-prominent category shows...

...in 80% of states, workforce development is the single most common category, with climate and housing coming in second and third, respectively.

When workforce development is excluded as a category, users can see the other categories states are most impacted by:

Most Prominent CEJST Category by State (Excluding Workforce Development)

Recommendation:

Enable category filtering to show regional trends of impact to more easily inform program and funding prioritizations.

Prioritize community engagement & agency guidance

Despite the national coverage of the tool, it falls short in reflecting the inherent regional nuances associated with environmental justice issues. Federal agencies can continue to improve in involving communities in refining this tool.

Prioritize community engagement.

While useful, Google Groups and public comments biases towards groups with awareness and capacity.

- ❑ Lean on trusted partners and perform outreach with compensation → There is precedent for doing so. ([Link](#))
- ❑ Leverage higher quality *local* data when available → Incorporate local layers from states or municipal tools
- ❑ Collect data on who uses CEJST → This could inform who isn't currently using the tool, but should?

Prioritize community engagement.

Local validation by environmental justice experts who live in the nation's most burdened communities should be CEQ's north star. Making the 'self designation' process clearer would be a significant start.

Currently, requests for additional data and self designation is buried in the About section....

For example, Illinois makes this process much clearer for stakeholders.

The screenshot displays the Illinois Solar For All website. The top navigation bar includes the logo, the text "Illinois Solar For All", and links for "Events", "Announcements", "Newsletters", "Stay Updated", and "Find an Approved Vendor". Below this, a secondary menu lists "For Illinois Residents", "For Vendors", "Programs", "Job Training", "Grassroots Education", "Environmental Justice Communities", and "Consumer Protections". The main content area features a blue background with the heading "Accessing the benefits of Illinois Solar for All". Below the heading is a paragraph: "Use this address lookup tool to see if your community or property resides in an identified environmental justice community. Ready to designate your community? Click below to submit an application for review by the Program Administrator." Two yellow buttons are present: "Address Lookup" and "Apply to Designate Your Community". The "Apply to Designate Your Community" button is highlighted with a green border. To the right of the text is a map of Illinois and Indiana.

Recommendation:

CEQ can continue improving community involvement when refining the tool & set clearer guidance on how various screening tools relate to one another.

Discussion

(and thank you for your
engagement thus far!)
